	Approved For Release 2003/08/06 : Cl	
	CLASSIFICATION	A-RDP80-00810A002400470001-3 25X1 46/
	CENTRAL I	REPORT NO.
	INFORMATION R	EPORT CD NO. 25X1A
COUNTRY	East Germany	DATE DISTR. 6 October 1953
SUBJECT	Research Activities of the East German Wasserwirtschoft	Amt fuer NO. OF PAGES
PLACE ACQUIRED	2	25X1
DATE OF INFO.		SUPPLEMENT TO REPORT NO.
THIS DOCUMENT OF THE BUTTED OF THE BUTTED OF THE CONTENTS SHOULD BY LAW.	DEFENDING STREET SHEET BORNES OF HOMOGRAND	THIS IS UNEVALUATED INFORMATION
	25X	<u>(1</u>
	kilometer water pipes of greater than no purposes. The importation of such pipes proven difficult and unsatisfactory. Do	from the satellite countries has
2.	purposes. The importation of such pipes proven difficult and unsatisfactory. Defind a substitute for critically short of Before 1945, experiments were made to cappipes which show a high degree of hardner corrosion, and show little wear from the Although basalt melts readily at 1200 depipes showed little mechanical consister technologically. An attempt to solve the methods proved unsatisfactory. The extrato produce because the extrusion of power is difficult. The firm of Hescho in Hermsdorf was ordered such pipes by the addition of kaoling also were unsatisfactory. The Berliner powder to the basalt but also with unsatisfied at 1200 to 1300 degree also extremely brittle. Experimental tent basalt was to be resumed in Claswerk failures, funds for this research were contained to the contained of the contained at 1200 to 1300 degree also extremely brittle.	ermal diameter for compensation of from the satellite countries has operiments started during the war to east iron are being continued. In the salt into pipe forms producing east, which are highly resistant to expense Sentigrade, the resulting east and normally conducted in water. Express Sentigrade, the resulting east and the process was too complicated its problem by powder metallurgical ended pipes were porous and difficult dered basalt mixed with binding agents. The results from these experiments Gluehlampework thied adding iron insfactory results. Pressed objects were centigrade are very hard, but esting with the melling and casting Weisswasser.1/ After all the 1952
2.	purposes. The importation of such pipes proven difficult and unsatisfactory. Exfind a substitute for critically short of Before 1945, experiments were made to capipes which show a high degree of hardne corrosion, and show little wear from the Although basalt melts readily at 1200 depipes showed little mechanical consister technologically. An attempt to solve the methods proved unsatisfactory. The extra to produce because the extrusion of powers difficult. The firm of Hescho in Hermsdorf was order of such pipes by the addition of kaolineals owere unsatisfactory. The Berliner powder to the basalt but also with unsatisfactory are sintered at 1200 to 1300 degree also extremely brittle. Experimental tent of basalt was to be resumed in Glaswerk	ermal diameter for compensation from the satellite countries has aperiments started during the war to east iron are being continued. In the said into pipe forms producing less, which are highly resistant to example said normally conducted in water. In the process was too complicated this problem by powder metallurgical maded pipes were porous and difficult leaved basalt mixed with binding agents ared to try to increase the plasticity. The results from these experiments Gluehlampements tried adding iron disfactory results. Pressed objects was centificated are very hard, but the sting with the melbing and casting Weisswasser. 1/ After all the 1952 ut with the exception of a small.
2.	purposes. The importation of such pipes proven difficult and unsatisfactory. Experiments were made to capipes which show a high degree of hardne corrosion, and show little wear from the Although basalt melts readily at 1200 depipes showed little mechanical consister technologically. An attempt to solve the methods proved unsatisfactory. The extrato produce because the extrusion of powers difficult. The firm of Mescho in Mermsdorf was ordered such pipes by the addition of kaoline also were unsatisfactory. The Berliner provider to the basalt but also with unsatisfied are sintered at 1200 to 1300 degree also extremely brittle. Experimental tends basalt was to be resumed in Claswerk failures, funds for this research were canount for Glaswerk Weisswasser.	ermal diameter for compensation is from the satellite countries has operiments started during the war to east iron are being continued. In the salt into pipe forms producing east, which are highly resistant to east during and the process was too complicated only and the process was too complicated only and the process was too complicated east problem by powder metallurgical maded pipes were porous and difficult where disable mixed with binding agents ared to try to increase the plasticity. The results from these experiments Gluehlampemork thied adding iron disfactory results. Pressed objects was centificated are very hard, but so sting with the melbing and casting Weissmasser. 1/ After all the 1952 but with the exception of a small.
